Percent Composition. Empirical and

## Molecular Formulas

## Law of Definite Proportions

This law states that the elements in a chemical compound are always present in the same proportions by mass.

For example, the mass\% of oxygen in water is always $88.8 \%$ and the mass of hydrogen is $11.2 \%$.

# Calculating Percentage Composition 

 - relative mass of each element in a compound i) Using Mass DataEx. A compound with a mass of 50 g is found to contain 32.3 g of zinc and 17.7 g of sulfur. What is the percentage composition of the compound?

## ii) Calculating \% Composition using formula

Steps to Solve for Percent Composition
(with example)

$$
\mathrm{PCl}_{5} \quad \text { (Phosphorus Pentachloride) }
$$

1) Find the molar mass of all elements in the compound:

$$
\begin{aligned}
& \mathrm{P}=30.974 \mathrm{~g} \\
& \mathrm{Cl}=5(35.453 \mathrm{~g})=177.265 \mathrm{~g}
\end{aligned}
$$

2) Find the molecular mass:

$$
\mathrm{PCl}_{5}=30.974 \mathrm{~g}+177.265 \mathrm{~g}=208.239 \mathrm{~g}
$$

3) Divide each molar mass by the molecular mass and multiply by 100 :

$$
\begin{aligned}
& \mathrm{P}=\frac{30.974 \mathrm{~g}}{208.239 \mathrm{~g}} \times 100=\underline{14.87 \%} \\
& \mathrm{Cl}=\frac{177.265 \mathrm{~g}}{208.239 \mathrm{~g}} \times 100=\underline{85.13 \%}
\end{aligned}
$$

Therefore, Phosphorus Pentachloride is $14.87 \% \mathrm{P}$ and $85.13 \% \mathrm{Cl}$ by mass.

## Calculating Percentage Composition

 Ex. b) Determine the percentage composition of $\mathrm{Ca}_{3}\left(\mathrm{PO}_{4}\right)_{2}$.Homework:
Practice: p. 286 \#1. 2 and p. 287 \#3
Questions: p. 288 \#1, 2, 4,5.7

## Formulas

Empirical formula: the lowest whole number ratio of atoms in a compound. Molecular formula: the true number of atoms of each element in the formula of a compound.

I molecular formula $=$ (empirical formula) ${ }_{n}$
$\square$ molecular formula $=\mathrm{C}_{6} \mathrm{H}_{6}=(\mathrm{CH})_{6}$
$\square$ empirical formula $=\mathrm{CH}$

## Formulas (continued)

Formulas for ionic compounds are ALWAYS empirical (lowest whole number ratio).

Examples:

$$
\begin{array}{ll}
\mathrm{NaCl} & \mathrm{Al}_{2}\left(\mathrm{SO}_{4}\right)_{3} \\
\mathrm{MgCl}_{2} & \mathrm{~K}_{2} \mathrm{CO}_{3}
\end{array}
$$

## Formulas (continued)

Formulas for molecular compounds MIGHT be empirical (lowest whole number ratio).

Molecular: $\mathrm{H}_{2} \mathrm{O}$

Empirical: $\mathrm{H}_{2} \mathrm{O}$
$\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ $\downarrow$
$\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}$
$\mathrm{CH}_{2} \mathrm{O}$
$\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}$

## Empirical Formula Determination

1. If given percentages of elements. assume you have 100 grams of the compound. Determine moles of each element in $\mathbf{1 0 0}$ grams of the compound.
2. Divide each value of moles by the smallest of the mole values.
3. Multiply each number by an integer to obtain all whole numbers.

Given:

## Mass \% elements

Assume 100 g sample

## Find:

# Empirical 

 formula
## (Divide by

 smallest andmultiply to $\begin{aligned} & \text { Calculate } \\ & \text { make }\end{aligned}$
mole ratio whole)

Moles of each element

Sample Problem \#1 Using a Table: What is the empirical formula for a compound with $48 \%$ C. 8\% H, 28\% N and 16\% O?

| Ellement | $\begin{array}{\|c\|} \hline \text { Mass(g) } \end{array}$ | Atamic mass (Molar Mass) | Atamic ratio (Moles) | $\begin{array}{\|l} \hline \text { Simplest } \\ \text { ratiol } \end{array}$ Divide by smallest mole | Simplest whole no.ratio |
| :---: | :---: | :---: | :---: | :---: | :---: |
| C | 48, 0 | 12 | $\frac{48.0}{12}=4.0$ | $\frac{4.0}{1.0}=4$ | 4 |
| H | B, 1 | 1 | $\frac{8.0}{1}=8,0$ | $\frac{8.0}{1.0}=8$ | 8 |
| N | 28,0 | 14 | $\frac{28.0}{14}=2.0$ | $\frac{2.0}{1.0}=2$ | 2 |
| 0 | 16.0 | 16 | $\frac{16,0}{16}=1,0$ | $\frac{1.0}{1.0}=1$ | 1 |

Example \#2: What is the empirical formula if there is 8.4 g of Carbon, 2.1 g of Hydrogen and 5.6 g of Oxygen?

| ATOM | MASS | MOLAR MASS | MOLES | (mole) SMALLEST MOLE | RATIO |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\Gamma$ | 0.4 | $170$ | 0.7 | $\frac{0.7}{0.35} \quad 2$ | $2$ |
| $1+$ | $\geq 11$ | $10$ | $2.1$ | $\frac{2.1}{0.35} \quad 6$ | $\square$ |
|  | $5 \cdot 0$ | 10.0 | $0.35$ | $\frac{0.35}{0.35}$ | 1 |

## Empirical Formula Determination

Ex. 3 Adipic acid contains $49.32 \%$ C. $43.84 \%$ O. and $6.85 \% \mathrm{H}$ by mass. What is the empirical formula of adipic acid?

Solution: Treat \% as mass (assuming we have 100 g ), and convert grams to moles.

$$
\stackrel{49.32 \mathrm{~g} \text { carbon }}{ } \left\lvert\, \frac{1 \text { mol carbon }}{12.01 \mathrm{~g} \text { carbon }}=4.107\right. \text { mol carbon }
$$

6.85 g hydrogen $\left\lvert\, \frac{1 \text { mol hydrogen }}{1.01 \mathrm{~g} \text { hydrogen }}=6.78 \mathrm{~mol}\right.$ hydrogen
43.84 g oxygen $\left\lvert\, \frac{1 \text { mol } \text { oxygen }}{16.00 \mathrm{~g} \text { oxygen }}=2.74\right.$ mol oxygen

## Empirical Formula Determination

2. Divide each value of moles by the smallest of the values.
Carbon: $\frac{4.107 \mathrm{~mol} \text { carbon }}{2.74 \mathrm{~mol}}=1.50$
Hydrogen: $\frac{6.78 \mathrm{~mol} \mathrm{hydrogen}}{2.74 \mathrm{~mol}}=2.47$
Oxygen:

$$
\frac{2.74 \text { mol } \text { oxygen }}{2.74 \mathrm{~mol}}=1.50
$$

## Empirical Formula Determination

3. Multiply each number by an integer to obtain all whole numbers.

Carbon: 1.50 Hydrogen: 2.50 Oxygen: 1.00

$$
\begin{array}{r}
2 \\
\times 3
\end{array}
$$

$$
\begin{array}{r}
\times 2 \\
\hline 5
\end{array}
$$

Empirical formula: $\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{2}$

## Finding the Molecular Formula

The empirical formula for adipic acid is $\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{2}$. The molar mass of adipic acid is $146 \mathrm{~g} / \mathrm{mol}$. What is the molecular formula of adipic acid?

1. Find the molar mass of the empirical formula - $\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{2}$

$$
3(12.01 \mathrm{~g})+5(1.01)+2(16.00)=73.08 \mathrm{~g}
$$

## Finding the Molecular Formula

The empirical formula for adipic acid is $\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{2}$. The molar mass of adipic acid is $146 \mathrm{~g} / \mathrm{mol}$. What is the molecular formula of adipic acid?

$$
M=3(12.01 \mathrm{~g})+5(1.01)+2(16.00)=73.08 \mathrm{~g}
$$

2. Divide the molar mass of the molecular formula (given) by the mass calculated for the empirical formula.

$$
\frac{146}{73}=2
$$

## Finding the Molecular Formula

The empirical formula for adipic acid is $\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{2}$. The molar mass of adipic acid is $146 \mathrm{~g} / \mathrm{mol}$. What is the molecular formula of adipic acid?
3. Multiply the empirical formula by this number to get the molecular formula.

$$
\frac{146}{73}=2 \quad\left(\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{2}\right) \times 2=\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{4}
$$

## Finding the Formula of a Hydrate

- A hydrate is any salt that has water chemically bonded to the ions in the crystal structure is a hydrate or hydrated crystal.
- Copper(II) sulfate pentahydrate is a hydrate.
- Hydrated copper(II) sulfate is deep blue in color.

- Other examples include:
- Calcium chloride dihydrate $=\mathrm{CaCl}_{2} \mathrm{C}_{2} \mathrm{H}_{2} \mathrm{O}$
- Chromium (III) nitrate hexahydrate $=\mathrm{Cr}\left(\mathrm{NO}_{3}\right)_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}$

## What is the compound called after the water has been removed?

- Anhydride (noun)
- The light blue powder is the anhydride.
- Anhydrous (adjective)
- Anhydrous copper(II) sulfate is left in the test tube after heating (water removed)

## Percent Composition and Formula of Hydrate

- A 5.0 gram sample of $\mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2} \cdot \mathrm{nH}_{2} \mathrm{O}$ is heated, and 3.9 g of the anhydrous salt remains. What is the value of $n$ ?

1. Amount of water lost
5.0 g hydrate

- 3.9 g anhydrous salt
1.1 g water

3. Amount (moles) of water
$n=0.22 \times 18.02=4.0$
4. Percent of water
1.1 g water $\times 100=22 \%$
5.0 g hydrate
