

NOMENCLATURE SUMMARY

Naming Compounds

A. Two Elements (BINARY Compounds)

1. Name each element
2. The 2nd element ends in "ide"

eg. CaS

calcium sulphide

* if the 1st element is multivalent:

a) Stock System (Roman Numerals) → I, II, III, IV, V, VI, VII, VIII

eg. Fe_2S_3 iron(II) sulphide
 CuO copper (II) oxide

b) ous - lower valence
ic - higher valence

eg. CuF cuprous fluoride
eg. CuF_2 cupric fluoride

c) Prefix → mono, di, tri, tetra, penta, hexa, ...

eg. N_2O_4 dinitrogen tetroxide

binary acid * if the 1st element is an H and the compound is (aq), it's an acid
- starts with hydro
- ends with ic

eg. $\text{HF}_{(\text{aq})}$ hydrofluoric acid

* Peroxides - have one more than the usual number of oxygens

eg. H_2O_2 → hydrogen peroxide

B. Three Elements

1. Name the 1st element
2. The rest is a polyatomic ion

Eg. NO_3^- nitrate

1 more O than 'ate' - per nitrate
1 less O than 'ate' - nitr ous
2 less O than 'ate' - hypo nitr ous

* keep in mind if the 1st element is multivalent

eg. $\text{Ba}(\text{ClO}_4)_2$ barium perchlorate
eg. $\text{Cu}(\text{NO}_2)_2$ copper (II) nitrite

OXY acids * if the 1st element is an H, it's an acid
- ic - from 'ate' polyatomic ions
- ous - from 'ite' polyatomic ions

per — ic → from 'per — ate'
hypo — ous → from 'hypo — ite'

eg. H_2SO_4 (aq) sulphuric acid

eg. HClO (aq) hypochlorous acid

eg. H_2SO_3 (aq) hyposulfurous acid

C. Four Elements (Acid Salts)

1. Name the 1st element
2. The 2nd element is hydrogen
3. The rest is a polyatomic ion

eg. $\text{Na}_2(\text{HPO}_4)$

sodium monohydrogen phosphate

* keep in mind if the 1st element is multivalent

D. End With H_2O

1. Name the compound
2. Place the numerical prefix before "hydrate"

eg. $\text{ZnCO}_3 \cdot 3\text{H}_2\text{O}$

zinc carbonate trihydrate

Writing Formulas

* Break the compound down, keeping in mind:

criss-cross valences

A. If it ends in - ide → 2 elements

eg. Lithium chloride

Li Cl

→ 3 elements if OH, CN

eg. Calcium hydroxide

Ca(OH)_2

- ate, ite → 3 elements

eg. Copper (II) sulphate

CuSO_4

B. Acids - H goes in front [aq follows]

- hydro....ic → 2 elements

eg. Hydrochloric acid

HCl(aq)

-ic → 3 elements

eg. Chloric acid

$\text{HClO}_3 \text{ (aq)}$

(hydrogen chlorate)

phosphorous acid

$\text{H}_3\text{PO}_3 \text{ (aq)}$

(hydrogen phosphite)
